What are Cryptocurrencies? Brief Introduction

Cryptocurrencies are virtual currencies designed to carry out secure financial transactions through a decentralized network that uses strong cryptography. This decentralized control of cryptocurrencies works through a distributed ledger technology known as blockchain, that serves as a public financial transaction database in which all transactions are being recorded.

The history of Cryptocurrencies goes back in 2009 with the launch of Bitcoin. Although during its introduction and early years Bitcoin received a lot of criticism, over the years it has grown in value reaching to a remarkable price of around \$19,000 in 2017. Bitcoin is steadily being embraced from Investors from a wider audience all around the world thus improving its credibility over the years, with investors becoming even more interested in instruments from this asset class. In fact, many people view it as an alternative investment that could become the future of worldwide payments.

Our cutting edge and easy to use platforms provide you with the opportunity to trade on some of the most popular Crypto CFDs -Bitcoin, Ethereum, Ripple, Litecoin and much more- and potentially profit through speculating on the price fluctuations of these Cryptocurrencies.
